## SECTION B:

There are FIVE questions in this section. Answer all Questions.
Show clearly, where necessary, how you arrive at the answer as the working will carry marks to.

## Question 1

a) All alkali metals react with water to produce hydrogen gas and the corresponding alkali metal hydroxide. A typical reaction is that between lithium and water:

$$
\mathrm{Li}(s)+\mathrm{H}_{2} \mathrm{O}(l) \rightarrow \mathrm{LiOH}(a q)+\mathrm{H}_{2}(g)
$$

How many grams of Li is needed to produce 9.89 g of $\mathrm{H}_{2}$ ?
b) Titanium is prepared by the reaction of titanium(IV) chloride with molten magnesium between $950^{\circ} \mathrm{C}$ and $1150^{\circ} \mathrm{C}$.

$$
\mathrm{TiCl}_{4}(g)+\mathrm{Mg}(I) \rightarrow \mathrm{Ti}(s)+\mathrm{MgCl}_{2}(I)
$$

If $3.54 \times 10^{7} \mathrm{~g}$ of $\mathrm{TiCl}_{4}$ reacts with $1.13 \times 10^{7} \mathrm{~g}$ of Mg :
(i) Calculate the theoretical yield of Ti in grams.
(ii) Calculate the percent yield if $7.91 \times 10^{6} \mathrm{~g}$ of Ti are actually obtained.

## Question 2

a) How many grams of potassium dichromate are required to prepare a 250 mL solution whose concentration is 2.16 M ?
b) Describe how you would prepare $5.00 \times 10^{2} \mathrm{~mL}$ of a 1.75 M sulphuric acid solution, starting with a 8.16 M stock solution.

## Question 3

a) Sulfur hexafluoride is a colorless and odourless gas. Due to its lack of chemical reactivity, it is used as an insulator in electronic equipment. Calculate the pressure (in atm) exerted by 1.82 moles of gas in a steel vessel of volume 5.43 L at $69.5^{\circ} \mathrm{C}$.
b) Calculate the volume (in L) occupied by 7.40 g of ammonia at STP.
c) A flammable gas made up of carbon and hydrogen is found to effuse through a porous barrier in 1.50 min . Under the same conditions and pressure it takes an equal volume of bromine vapour 4.73 min to effuse through the same barrier. Calculate the molar mass of the unknown gas.

## Question 4

a) Calculate the pH of (i) a $1.0 \times 10^{-3} \mathrm{M} \mathrm{HCl}$ solution and (ii) $0.020 \mathrm{M} \mathrm{Ba}(\mathrm{OH})_{2}$ solution.
b) Calculate the pH of a 0.036 M nitrous acid $\left(\mathrm{HNO}_{2}\right)$ solution:

$$
\mathrm{HNO}_{2}(\mathrm{aq}) \leftrightarrow \mathrm{H}+(\mathrm{aq})+\mathrm{NO}_{2}^{-}(\mathrm{aq})
$$
