NAMIBIA UNIVERSITY
OF SCIENCE AND TECHNOLOGY

FACULTY OF HEALTH AND APPLIED SCIENCES

DEPARTMENT OF MATHEMATICS AND STATISTICS

QUALIFICATION: Bachelor of Science in Applied Mathematics and Statistics	
QUALIFICATION CODE: 07BAMS	**LEVEL:** 7
COURSE CODE: DAE702S	**COURSE NAME:** DESIGN AND ANALYSIS OF EXPERIMENTS
SESSION: NOVEMBER2019	**PAPER:** THEORY
DURATION: 3 HOURS	**MARKS:** 100

FIRST OPPORTUNITY EXAMINATION QUESTION PAPER	
EXAMINERS	DR C.R KIKAWA
MODERATOR:	PROF PETER NJUHO

INSTRUCTIONS

1. Answer ALL the questions in the booklet provided.
2. Show clearly all the steps used in the calculations.
3. All written work must be done in blue or black ink and sketches must be done in pencil.

PERMISSIBLE MATERIALS

1. Non-programmable calculator without a cover.

ATTACHMENTS

Standard Normal Distribution table, Inverse Cum Freq Distribution table, t-table, f-tables (T-12 to T 19)

THIS QUESTION PAPER CONSISTS OF 5 PAGES (including this front page)

NAMIBIA UNIVERSITY OF SCIENCE AND TECHNOLOGY
DEPARTMENT OF MATHEMATICS AND STATISTICS
DESIGN & ANALYSIS OF EXPERIMENTS: DAE702S

EXAMINATION FIRST OPPORTUNITY: NOVEMBER 2019

Time-3 Hrs **Attempt all Questions** **Maximum Marks - 100**

---

1. Question

   (a) Discuss the following concepts as used in experimental design:

   1. Blinding
   2. Control Treatment
   3. Responses
   4. Randomization
   5. Placebo

   (15 marks, (3@))

   (b) Briefly discuss two examples that could best distinguish an experimental unit and a measurement unit.
   (**Hint:** One example should be agricultural and the other educational) **(5 marks)**

2. Question
   The diameters of steel shafts produced by a certain manufacturing process should have a mean diameter of 0.255 inches. The diameter is known to have a standard deviation of $\sigma = 0.0001$ inch. A random sample of 10 shafts has an average diameter of 0.2545 inches.

   (a) Set up the appropriate hypotheses on the mean μ. **(2 marks)**

   (b) Test these hypotheses using $\alpha = 0.05$. What are your conclusions? **(10 marks)**

   (c) What is the p-value for the test in part (b)? **(3 marks)**

   (d) Find a 95% confidence interval on the mean. **(5 marks)**

3. Question

A manufacturer of television sets is interested in the effect of tube conductivity of four different types of coating for color picture tubes. The following conductivity data are obtained:

Coating Type	Conductivity			
1	143	141	150	146
2	152	149	137	143
3	134	136	132	127
4	129	127	132	129

Figure 1: Data table

(a) Is there a difference in conductivity due to coating type? Motivate your answer with reference to the output below. Use $\alpha = 0.05$. **(5 marks)**

ANOVA for Selected Factorial Model

Analysis of variance table [Partial sum of squares]

Source	Sum of Squares	DF	Mean Square	F Value	Prob > F	
Model	844.69	3	281.56	14.30	0.0003	significant
A	*844.69*	*3*	*281.56*	*14.30*	*0.0003*	
Residual	236.25	12	19.69			
Lack of Fit	*0.000*	*0*				
Pure Error	*236.25*	*12*	*19.69*			
Cor Total	1080.94	15				

Figure 2: ANOVA Table

(b) Estimate the overall mean and the treatment effects. . **(10 marks)**

(c) Compute a 95 percent interval estimate of the mean of coating type 4. Compute a 99 percent interval estimate of the mean difference between coating types 1 and 4. **(5 marks)**

4. Question

The response time in milliseconds was determined for three different types of circuits that could be used in an automatic valve shutoff mechanism. The results are shown in the following table.

Circuit Type	Response Time				
1	9	12	10	8	15
2	20	21	23	17	30
3	6	5	8	16	7

Figure 3: Table of values

(a) Test H_0,that the three circuit types have the same response time at $\alpha = 0.01$. **(10 marks)**

(b) Use Tukey's test to compare pairs of treatment means, $\alpha = 0.01$. The following information may be useful in your computations. **(10 marks)**

Treatment Means (Adjusted, If Necessary)

	Estimated Mean	Standard Error
1-1	10.80	1.84
2-2	22.20	1.84
3-3	8.40	1.84

Figure 4: Tables of means

Also,

$$S_{\bar{y}.} = \sqrt{MSE/n}\ \sqrt{1690/5} = 1.8385 \text{ and } t_0 = 9.266$$

5. Question

Here we quote an experiment that had been designed as a Latin square. The skins of rabbits' backs were inoculated with a diffusing factor in six separate sites. Six rabbits were therefore used and the order in which the sites were inoculated was done six different ways. The outcome measured was area of blister (cm). The overall objective was to see whether or not the order of administration affected this outcome. The experimental design and data are represented in the Latin square below.

(a) Discuss the two main advantages and two disadvantages of the Latin square design. **(8 marks)**

(b) From the Latin square test presented below, discuss the research findings (Strictly stick to the objective of the research as stated) **(7 marks)**

Factors: Rabbit, Position, Order.

Source of Variation	Sum Squares	DF	Mean Squa
Rows	3.833333	5	0.766667
Columns	12.833333	5	2.566667
Treatments	0.563333	5	0.112667
Residual	13.13	20	0.6565
Total	30.36	35	

F (rows) = 1.167809, P = .3592

F (columns) = 3.909622, P = .0124

F (treatments) = 0.171617, P = .9701

Figure 5: General ANOVA for a RCBD

(c) Discuss the concepts of a Latin Square design. **(5 marks)**

END

STANDARD NORMAL DISTRIBUTION: Table Values Represent AREA to the LEFT of the Z score.
