## FACULTY OF HEALTH, APPLIED SCIENCES AND NATURAL RESOURCES

DEPARTMENT OF NATURAL AND APPLIED SCIENCES

| QUALIFICATION: BACHELOR OF SCIENCE |  |
| :--- | :--- |
| QUALIFICATION CODE: 07BOSC | LEVEL: 7 |
| COURSE CODE: MSC701S | COURSE NAME: MOLECULAR SPECTROSCOPY AND <br> CHEMICAL SEPARATION METHODS |
| SESSION: JULY 2022 | PAPER: THEORY |
| DURATION: 3 HOURS | MARKS: 100 |

| SUPPLEMENTARY/SECOND OPPORTUNITY EXAMINATION QUESTION PAPER |  |
| :--- | :--- |
| EXAMINER(S) | DR JULIEN LUSILAO |
| MODERATOR: | DR STEFAN LOUW |

## INSTRUCTIONS

1. Answer ALL the questions in the answer book provided.
2. Write and number your answers clearly.
3. All written work MUST be done in blue or black ink.

## PERMISSIBLE MATERIALS

Non-programmable calculators
ATTACHMENTS
List of useful formulas and constants

THIS QUESTION PAPER CONSISTS OF 8 PAGES (Including this front page and attachments)

## Question 1

1.1 Define the following terms
(a) Sensors
(b) A readout device
(c) Absorbance
1.2 It is critical in UV-Vis to measure the $100 \%$ transmittance ( $100 \% \mathrm{~T}$ ). This measurement is always carried out with a sample blank. Provide a clear explanation of the relevance of $100 \%$ T in UV-Vis and the reason why a blank is used for that measurement.
1.3 The following diagram describes different phenomena that occur when the electromagnetic radiation interacts with the matter

Name the phenomena described in A to C and explain your choices.
1.4 Differentiate between
(a) Continuum and line sources of electromagnetic radiation.
(b) Monochromator and polychromator.

## Question 2

2.1 The following diagram represents a spectrophotometer used for measuring Phosphorescence:

Briefly explain how it operates.
2.2 The following questions are related to the use of plasmas as thermal sources of energy
(a) Use the Boltzmann distribution equation to explain why a plasma provide a better atomization as compared to both flame and graphite furnace.
(b) Besides improving excitation and ionization efficiencies, what other advantage does the higher temperature of plasmas have over flames and furnaces?
(c) Name three types of plasma sources used in optical emission techniques.
2.3 The burner assemblies of atomic absorption spectrometers (AAS) are known to provide a long optical pathlength as well as a stable flame and they can also move horizontally and vertically. Explain the importance of the underlined properties in the statement above.
2.4 The table below shows atomic emission lines for a Cr hollow cathode lamp.

| $\boldsymbol{\lambda}$ <br> $(\mathrm{nm})$ | Slit width <br> $(\mathrm{nm})$ | $\mathrm{mg} \mathrm{Cr} / \mathrm{L}$ giving <br> $\mathbf{A}=\mathbf{0 . 2 0}$ | $\mathbf{P}_{\mathbf{0}}$ <br> (relative) |
| :---: | :---: | :---: | :---: |
| 357.9 | 0.2 | 2.5 | 40 |
| 425.4 | 0.2 | 12 | 85 |
| 429.0 | 0.5 | 20 | 100 |
| 520.5 | 0.2 | 1500 | 15 |
| 520.8 | 0.2 | 500 | 20 |

(a) Which analytical technique uses hollow cathode lamps and why?
(b) For the Cr hollow cathode lamp in the table above, which wavelength provides the best sensitivity? Explain your answer.
(c) When analyzing samples containing $\approx 10 \mathrm{mg} \mathrm{Cr} / \mathrm{L}$, which wavelength(s) would you expect to provide a reasonable sensitivity with less uncertainty in the measured

## Question 3

3.1 How do you adjust the selectivity, $\alpha$, in gas chromatography (GC) and in liquid chromatography (LC)?
3.2 The figures below show how the mobile phase pH affect both (a) the retention time of the solutes, $t_{r}$, and (b) their selectivity, $\alpha$.

(a) What unwanted situations would occur if the analysis was carried using a mobile phase
(i) at pH between 5.0 and 5.5 ?
(ii) at pH 3.5 ?
(b) Figure (b) is also called a window diagram and is used to find the optimum separation by plotting $\alpha$ for each pair of solutes. Explain, using this figure, what would the optimum mobile phase pH be to obtain the best chromatographic separation of these 4 components.
3.3 The following figure shows the effect of flow rate on the column's plate height.

(a) In the Van Deemter Equation: $H=A+B / u+C u$, which parameter is affected by changing the flow rate of a chromatographic system and what is that parameter called?
(b) Explain the change (i.e. decreasing or increasing trend) observed in the size of the plate height when increasing the flow rate.
(c) Which optimum flow rate would you use to obtain the best efficiency with the three particle sizes in the figure above and why?
(d) Assuming you have two columns with particle sizes $3 \mu \mathrm{~m}$ and $10 \mu \mathrm{~m}$. Which one would you choose to carry out your analysis (assuming all other characteristics are similar for both columns) and why?
3.4 A 1.5 m column has 45000 plates per meter. Analyte $A$ has a retention time of 16.3 minutes, analyte $B$ has a retention time of 17.1 minutes and the dead (or void) time is 5.14 minutes.
(a) What is the resolution for $A$ and $B$ on this column?
(b) What is the selectivity of the column ?

## Question 4

4.1 Briefly explain how solutes separate in a mixture when using the following chromatographic techniques
(a) Adsorption chromatography
(b) Partition chromatography
(c) Ion-exchange chromatography
(d) Size-exclusion chromatography
4.2 Name and briefly explain the different injection systems used in GC.
4.3 Two HPLC systems are defined below, and the following compounds are to be separated

Resorcinol

Phenol

Nitrobenzene

HPLC system 1: uses silica stationary phase with hexane as the mobile phase.
HPLC system 2: uses $\mathrm{C}_{18}$ stationary phase with a mobile phase consisting of $30 \%$ water and 70\% acetonitrile.
a) Name the mode of separation (normal phase / reverse phase) using system 1.
b) Name the mode of separation (normal phase / reverse phase) using system 2.
c) Predict the elution order for the three compounds in a chromatogram using system 2 and explain your choice.
4.4 Given the diagram below, explain the elution order of cations, neutral solutes and anions in electrophoresis.

Physical Constants

| Gas constant | $R$ | $=8.315 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$ |
| :---: | :---: | :---: |
|  |  | $=8.315 \mathrm{kPa} \mathrm{dm}^{3} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$ |
|  |  | $=8.315 \mathrm{~Pa} \mathrm{~m}^{3} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$ |
|  |  | $=8.206 \times 10^{-2} \mathrm{~L} \mathrm{~atm} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$ |
| Boltzmann constant | k | $=1.381 \times 10^{-23} \mathrm{~J} \mathrm{~K}^{-1}$ |
| Planck constant | $h$ | $=6.626 \times 10^{-34} \mathrm{~J} \mathrm{~s}^{-1}$ |
| Faraday constant | F | $=9.649 \times 10^{4} \mathrm{C} \mathrm{mol}^{-1}$ |
| Avogadro constant | Lor $\mathrm{N}_{\mathrm{A}}$ | $=6.022 \times 10^{23} \mathrm{~mol}^{-1}$ |
| Speed of light in vacuum | $c$ | $=2.998 \times 10^{8} \mathrm{~m} \mathrm{~s}^{-1}$ |
| Mole volume of an ideal gas | $V_{m}$ | $=22.41 \mathrm{~L} \mathrm{~mol}^{-1}$ (at 1 atm and 273.15 K ) |
|  |  | $=22.71 \mathrm{~L} \mathrm{~mol}^{-1}$ (at 1 bar and 273.15 K ) |
| Elementary charge | $e$ | $=1.602 \times 10^{-19} \mathrm{C}$ |
| Rest mass of electron | $m_{e}$ | $=9.109 \times 10^{-31} \mathrm{~kg}$ |
| Rest mass of proton | $m_{p}$ | $=1.673 \times 10^{-27} \mathrm{~kg}$ |
| Rest mass of neutron | $m_{n}$ | $=1.675 \times 10^{-27} \mathrm{~kg}$ |
| Permitivity of vacuum | $\varepsilon$ 。 | $=8.854 \times 10^{-12} \mathrm{C}^{2} \mathrm{~J}^{-1} \mathrm{~m}^{-1}\left(\right.$ or $\left.\mathrm{F} \mathrm{m}^{-1}\right)$ |
| Gravitational acceleration | $g$ | $=9.807 \mathrm{~m} \mathrm{~s}^{-2}$ |
