## ПATIBIA UПIVERSITY OF SCIEחCE AחD TECHחOLOGY

## FACULTY OF HEALTH, NATURAL RESOURCES AND APPLIED SCIENCES SCHOOL OF NATURAL AND APPLIED SCIENCES DEPARTMENT OF BIOLOGY, CHEMISTRY AND PHYSICS

| QUALIFICATION: BACHELOR OF SCIENCE |  |
| :--- | :--- |
| QUALIFICATION CODE: O7BOSC | LEVEL: 7 |
| COURSE CODE: MSC701S | COURSE NAME: MOLECULAR SPECTROSCOPY AND |
| CHEMICAL SEPARATION METHODS |  |$|$| PAPER: THEORY |
| :--- |
| SESSION: JUNE 2023 |
| DURATION: 3 HOURS |

| FIRST OPPORTUNITY EXAMINATION QUESTION PAPER |  |
| :--- | :--- |
| EXAMINER(S) | DR JULIEN LUSILAO |
| MODERATOR: | A/PROF STEFAN LOUW |

## INSTRUCTIONS

1. Answer ALL the questions in the answer book provided.
2. Write and number your answers clearly.
3. All written work MUST be done in blue or black ink.

## PERMISSIBLE MATERIALS

Non-programmable calculators

ATTACHMENTS
List of Useful formulas and Constants

THIS QUESTION PAPER CONSISTS OF 8 PAGES (Including this front page and attachments)

## Question 1

1.1 Define the following terms
(a) Detectors
(b) Transducers
(c) Radiant power (or intensity)
1.2 What principal phenomena are known to cause inaccuracies in the measurement of transmittance $(\mathrm{T})$ with spectrometric instruments?
1.3 What is the experimental approach used by analytical chemists to circumvent the limitation mentioned in 1.2?
1.4 Differentiate between the quantitative and qualitative information obtained with spectrometry techniques.
1.5 The diagram below shows different regions of the electromagnetic spectrum.

(a) Name the regions labelled from A to E .
(b) What type of quantum transitions are involved in the following regions of the above diagram?
(i) A region
(ii) B region
(iii) C region

## Question 2

2.1 What are the considerations to be taken when developing a quantitative atomic absorption (AA) method?
2.2 (a) Why are hollow cathode lamps preferred in AAS instruments instead of the lamps used in UV-Vis spectrometers?
(b) Describe the principle of operation of a hollow cathode lamp.
(c) What are chemical interferences in AAS technique and how do you correct them?
2.3 The diagram below represents an instrument that measures fluorescence.

(a) What is the main advantage of replacing the filters in $A$ and $B$ by monochromators and what would the instrument be called in that case?
(b) Why is the detector perpendicular to the radiation source?
(c) It has been reported that photoluminescence spectra are recorded by measuring the intensity of emitted radiation as a function of either the excitation wavelength or the emission wavelength. Using the above diagram as a reference, explain how both measurements (i.e., of excitation or emission spectra) can be made.

## Question 3

3.1 In the chromatographic separation of solutes $A$ and $B$, one of the simplest ways to improve resolution between their peaks is to adjust solute B's retention factor as shown in the figure below.

(a) Use the figure to discuss the limitations of this simplistic approach in improving resolution between two peaks.
(b) Describe how you can increase $k_{B}$ without significantly changing the selectivity in gas chromatography ( GC ) and in liquid chromatography (LC). Explain your choices.
3.2 In chromatography, the contributions of band broadening from multiple pathlengths $\left(H_{p}\right)$ and mass transfer $\left(H_{s}\right.$ and $\left.H_{m}\right)$ are expressed as follow:

$$
\begin{aligned}
& H_{p}=2 \lambda d_{p} \\
& H_{s}=\frac{q k d_{f}^{2}}{(1+k)^{2} D_{s}} u \\
& H_{m}=\frac{f n\left(d_{p}^{2}, d_{c}^{2}\right)}{D_{m}}
\end{aligned}
$$

(a) Define the terms $d_{c}, d_{f}$ and $d_{p}$ in the above expressions.
(b) Briefly show how capillary columns (CCs) take advantage of the above expressions to produce sharp chromatographic peaks in GC analysis.
3.3 Given the following chromatogram and a column length of 20 cm :

$t_{M}=2 \mathrm{~min} ; t^{\prime}{ }^{\prime}(A)=5 \mathrm{~min} ; \mathrm{t}_{\mathrm{R}}{ }^{\prime}(\mathrm{B})=10 \mathrm{~min}$

Calculate:
(a) The retention factor for solutes $A$ and $B$
(b) The number of theoretical plates for solutes $A$ and $B$ (for $w \sim 2 \mathrm{~min}$ ) and the average number of theoretical plates.
(c) The selectivity
(d) The resolution between for the solutes $A$ and $B$
(e) How would you classify the performance of the column based on the calculated retention factors?

## Question 4

4.1 What are the relevant criteria to consider when choosing a stationary phase in GC?
4.2 What are the ideal features of a detector used in GC?
4.3 Briefly discuss the main disadvantages of normal phase chromatography in HPLC.
4.4 Provide the reason why conductivity detectors used in lon-Exchange chromatography (IEC) have significant background signal and explain how this problem is minimized.
4.5 Explain the general principle of electrophoresis (i.e., how it works).
4.6 In the Van Deemter equation, $H=A+B / \mu+C \mu$
(a) Which term(s) is (are) not applicable to capillary electrophoresis? Explain your answer.
(b) What is the direct implication of the observation made in (a) in terms of column efficiency?

| Physical Constants |  |  |
| :---: | :---: | :---: |
| Gas constant | $R$ | $=8.315 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$ |
|  |  | $=8.315 \mathrm{kPa} \mathrm{dm}^{3} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$ |
|  |  | $=8.315 \mathrm{~Pa} \mathrm{~m}^{3} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$ |
|  |  | $=8.206 \times 10^{-2} \mathrm{~L} \mathrm{~atm} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$ |
| Boltzmann constant | $k$ | $=1.381 \times 10^{-23} \mathrm{~J} \mathrm{~K}^{-1}$ |
| Planck constant | $h$ | $=6.626 \times 10^{-34} \mathrm{~J} \mathrm{~s}^{-1}$ |
| Faraday constant | F | $=9.649 \times 10^{4} \mathrm{C} \mathrm{mol}^{-1}$ |
| Avogadro constant | Lor $\mathrm{N}_{\text {A }}$ | $=6.022 \times 10^{23} \mathrm{~mol}^{-1}$ |
| Speed of light in vacuum | $c$ | $=2.998 \times 10^{8} \mathrm{~m} \mathrm{~s}^{-1}$ |
| Mole volume of an ideal gas | $V_{m}$ | $=22.41 \mathrm{~L} \mathrm{~mol}^{-1}$ (at 1 atm and 273.15 K ) |
|  |  | $=22.71 \mathrm{~L} \mathrm{~mol}^{-1}$ (at 1 bar and 273.15 K ) |
| Elementary charge | $e$ | $=1.602 \times 10^{-19} \mathrm{C}$ |
| Rest mass of electron | $m_{e}$ | $=9.109 \times 10^{-31} \mathrm{~kg}$ |
| Rest mass of proton | $m_{p}$ | $=1.673 \times 10^{-27} \mathrm{~kg}$ |
| Rest mass of neutron | $m_{n}$ | $=1.675 \times 10^{-27} \mathrm{~kg}$ |
| Permitivity of vacuum | $\varepsilon_{0}$ | $=8.854 \times 10^{-12} \mathrm{C}^{2} \mathrm{~J}^{-1} \mathrm{~m}^{-1}\left(\right.$ or F m$\left.{ }^{-1}\right)$ |
| Gravitational acceleration | $g$ | $=9.807 \mathrm{~m} \mathrm{~s}^{-2}$ |
