| FIRST OPPORTUNITY EXAMINATION QUESTION PAPER |  |
| :--- | :--- |
| EXAMINER | Dr. Jacob Ong'ala |
| MODERATOR | Prof. Lilian Pazvakawambwa |

## INSTRUCTION

1. Answer all the questions
2. Show clearly all the steps in the calculations
3. All written work must be done in blue and black ink

## PERMISSIBLE MATERIALS

Non-programmable calculator without cover
THIS QUESTION PAPER CONSISTS OF 3 PAGERS (including the front page)

## QUESTION ONE - 20 MARKS

A first order moving average $M A(2)$ is defined by $X_{t}=z_{t}+\theta_{1} z_{t-1}+\theta_{2} z_{t-2}$ Where $z_{t} \sim$ $W N\left(0, \sigma^{2}\right)$ and the $z_{t}: t=1,2,3 \ldots, T$ are uncorrelated.
(a) Find
(i) Mean of the $M A(2)$
(ii) Variance of the $M A(2)$
[6 mks]
(iii) Autocovariance of the $M A(2)$
(iv) Autocorrelation of the $M A(2)$
(b) is the MA(2) stationary? Explain your answer

## QUESTION TWO - 20 MARKS

Use the following data shown in the table below to answer the questions that follow.

| t | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $Y_{t}$ | 7 | 8 | 9 | 11 | 13 | 16 | 14 | 13 | 18 | 17 |

Given $X_{t}=m_{t}+R_{t}$ such that $R_{t}$-is the random component following a white noise with a mean of zero and variance of $\sigma^{2}$ and $m_{t^{-}}$is the trend,
(a) Estimate the trend using exponential smoothing method with a smoothing parameter $\alpha=0.68$.
(b) Estimate the trend using a centred moving average of order 4
(c) On the same axes, draw the graphs of the original set of data, detrended data (using the exponential smoothing ) and detrended data (using the moving average) [7 mks]
(d) Which estimates in (a) or (b) above is a better estimate above ((a) or (b)) and why. [2 mks]

## QUESTION THREE - 22 MARKS

Consider $\operatorname{AR}(3): Y_{t}=\phi_{1} Y_{t-1}+\phi_{2} Y_{t-2}+\phi_{3} Y_{t-2}+\varepsilon_{t}$ where $\varepsilon_{t}$ is identically independently distributed (iid) as white noise.The Estimates the parameters can be found using Yule Walker equations as

$$
\begin{aligned}
& \left(\begin{array}{l}
\phi_{1} \\
\phi_{2} \\
\phi_{3}
\end{array}\right)=\left(\begin{array}{ccc}
1 & \rho_{1} & \rho_{2} \\
\rho_{1} & 1 & \rho_{1} \\
\rho_{2} & \rho_{1} & 1
\end{array}\right)^{-1}\left(\begin{array}{l}
\rho_{1} \\
\rho_{2} \\
\rho_{3}
\end{array}\right) \text { and } \\
& \sigma_{\varepsilon}^{2}=\gamma_{o}\left[\left(1-\phi_{1}^{2}-\phi_{2}^{2}-\phi_{3}^{2}\right)-2 \phi_{2}\left(\phi_{1}+\phi_{3}\right) \rho_{1}-2 \phi_{1} \phi_{3} \rho_{2}\right]
\end{aligned}
$$

where

$$
\hat{\rho_{h}}=r_{h}=\frac{\sum_{t=1}^{n}\left(X_{t}-\mu\right)\left(X_{t-h}-\mu\right)}{\sum_{t=1}^{n}\left(X_{t}-\mu\right)^{2}}
$$

$\hat{\gamma}_{o}=\operatorname{Var}=\frac{1}{n} \sum_{t=1}^{n}\left(X_{t}-\mu\right)^{2}$
$\mu=\sum_{t=1}^{n} X_{t}$
Use the data below to evaluate the values of the estimates $\left(\phi_{1}, \phi_{2}, \phi_{3}\right.$ and $\left.\sigma_{\varepsilon}^{2}\right)$
[22 mks]

| t | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $X_{t}$ | 13 | 17 | 15 | 14 | 19 | 22 | 20 | 26 | 32 | 32 |

## QUESTION FOUR - 18 MARKS

Consider the ARMA(1,1) process $X_{t}$ satisfying the equations $X_{t}-0.5 X_{t-1}=z_{t}+0.4 z_{t-1}$ Where $z_{t} \sim W N\left(0, \sigma^{2}\right)$ and the $z_{t}: t=1,2,3 \ldots, T$ are uncorrelated.
(a) Determine if $X_{t}$ is stationary
(b) Determine if $X_{t}$ is casual
(c) Determine if $X_{t}$ is invertible
(d) Write the coefficients $\Psi_{j}$ of the $M A(\infty)$ representation of $X_{t}$

## QUESTION FIVE - 20 MARKS

(a) Verify that ( $\max \rho_{1}=0.5$ nd $\min \rho_{1}=0.5$ for $-\infty<\theta<\infty$ ) for an $\mathrm{MA}(1)$ process: $X_{t}=\varepsilon_{t}-\theta \varepsilon_{t-1}$ such that $\varepsilon_{t}$ are independent noise processes.
(b) State the order of the following ARIMA( $\mathrm{p}, \mathrm{d}, \mathrm{q}$ ) processes
(i) $Y_{t}=(1+\phi) Y_{t-1}-\phi Y_{t-2}+e_{t}$
(ii) $Y_{t}=Y_{t-1}+e_{t}-\theta e_{t-1}$
(iii) $Y_{t}=5+e_{t}-\frac{1}{2} e_{t-1}-\frac{1}{4} e_{t-2}$
(iv) $Y_{t}=0.8 Y_{t-1}+e_{t}+0.7 e_{t-1}+0.6 e_{t-2}$
