**FACULTY OF HEALTH, NATURAL RESOURCES AND APPLIED SCIENCES**

**SCHOOL OF HEALTH AND APPLIED SCIENCES**

**DEPARTMENT OF BIOLOGY, CHEMISTRY AND PHYSICS**

<b>QUALIFICATION: BACHELOR OF SCIENCE (MAJOR AND MINOR)</b>	
<b>QUALIFICATION CODE: 07BOSC</b>	<b>LEVEL: 6</b>
<b>COURSE CODE: TPH601S</b>	<b>COURSE NAME: THERMAL PHYSICS</b>
<b>SESSION: JUNE 2023</b>	<b>PAPER: THEORY</b>
<b>DURATION: 3 HOURS</b>	<b>MARKS: 100</b>

<b>FIRST OPPORTUNITY EXAMINATION PAPER</b>	
<b>EXAMINER(S)</b>	DR VAINO INDONGO
<b>MODERATOR:</b>	PROF SYLVANUS ONJEFU

<b>INSTRUCTIONS</b>	
1.	Write all your answers in the answer booklet provided.
2.	Read the whole question before answering.
3.	Begin each question on a new page.
4.	The list of constants and useful formulae are on the last page of this paper.

**PERMISSIBLE MATERIALS**

1. Non-Programmable Scientific Calculator

**THIS PAPER CONSISTS OF 5 PAGES**

**(INCLUDING THIS FRONT PAGE)**

**QUESTION 1****(20)**

1.1 Briefly explain of the following thermodynamic terms:

- (i) Environment (2)
- (ii) Universe (2)
- (iii) Isobaric process (2)
- (iv) Temperature (2)

1.2 State the zeroth law of thermodynamics. (2)

1.3 A male student in a physics class takes two cups of water at 303 K and mixes them with one cup of water at 278 K (each mass of water weighs 50 g). Set the equation  $Q_{\text{total}} = 0$  and calculate the likely temperature of the mixture? Show your work/steps. (6)

1.4 A brass rod is 0.70 m long at 40°C. Find the increase in length of this rod at 70°C.  
(Hint:  $\alpha = 1.90 \times 10^{-5}/^{\circ}\text{C}$ ) (4)

**QUESTION 2****(20)**

2.1 A steam in cylindrical glass of height  $h = 100$  mm covered with a piston of mass 3500 g and has a cross sectional area of  $450 \text{ cm}^2$ . Determine the:

- (i) pressure that is exerted by this piston on the gas in the chamber, as shown in Figure 1. Assume gravitational acceleration 'g' to be  $9.81 \text{ m/s}^2$ . (4)
- (ii) work done when the same cylinder is heated afterwards at a constant pressure of 1 atm and its initial volume changes from  $V_0$  to  $5V_0$ . (4)

**Fig. 1**

2.2 An amount of heat  $Q$  was added to a substance (ice block) of mass 500 g at a temperature of  $-40^{\circ}\text{C}$  and is converted to steam at a temperature of  $140^{\circ}\text{C}$  (Fig 2). The specific heats,  $c$ , of ice, water and steam are  $2060 \text{ J/kg}\cdot^{\circ}\text{C}$ ,  $4180 \text{ J/kg}\cdot^{\circ}\text{C}$  and  $1870 \text{ J/kg}\cdot^{\circ}\text{C}$ , respectively. The latent heats of fusion and vaporizations are  $336 \text{ kJ/kg}$  and  $225 \text{ kJ/kg}$ , respectively. Determine:

(a) heat energy required to turn ice into water. (3)

(b) heat energy required to change the temperature of ice from  $-40^{\circ}\text{C}$  to  $0^{\circ}\text{C}$ . (3)

(c) total heat energy required to change the temperature of a substance between  $0^{\circ}\text{C}$  to  $120^{\circ}\text{C}$ . (6)

Fig. 2

**QUESTION 3** (20)

3.1 An ideal gas undergoes an *isothermal* (constant-temperature) compression at temperature  $T$ , with its volume changing from  $V_1$  to  $V_2$ .

(i) Prove that the work done during this process is given by an expression

$$W = nRT \ln \frac{P_1}{P_2}. \quad (6)$$

(ii) Is the work done positive or negative? Give reasons. (2)

3.2 A temperature of 120 moles of monoatomic ideal gas with a ratio  $\gamma = 1.600$  confined in a cylinder was increased from 273.15 K to 292.15 K at a uniform atmospheric pressure (1 atm). The cylinder was covered with a piston and the volume increases by  $4.28 \times 10^{-2} \text{ cm}^3$ . Calculate the amount of heat transferred. (5)

3.3 Use the relationships for specific heats,  $C_v$  and  $C_p$  as well as ideal gas constant  $R$  to prove that  $TV^{\gamma-1}$  is constant under an adiabatic condition. (7)

**QUESTION 4 (20)**

4.1 Define entropy and state the second law of thermodynamics. (3)

4.2 A gasoline truck engine takes in 35 kJ of heat and delivers 13.5 kJ of mechanical work per cycle. The heat is obtained by burning gasoline with heat of combustion

$$l_c = 5 \times 10^4 \text{ J/g. Calculate;}$$

(a) the thermal efficiency of this engine? (3)

(b) heat discarded per cycle (3)

(c) If the engine goes through 8 cycles per second, what is its power output in kW and hp? Hint: 1 hp = 746W (4)

(d) How much gasoline is burned in each cycle in kg? (4)

4.3 Suppose an engine absorbs 1000 J of heat at 383.15 K and expels 713 J at 273.15 K per cycle. Determine the total entropy of the system in one cycle. (3)

**QUESTION 5 (20)**

5.1 Show that internal energy ( $U$ ) is a thermodynamic potential which is a function of entropy and volume. (4)

5.2 Derive the differential form of Gibb's free energy/function from  $G = U + pV - TS$ . (6)

5.3 (i) The speeds of five molecules of a gas are 24k, 25k, 26k, 23k, 30k all in  $\text{ms}^{-1}$ , where k is equal to the number of molecules. Evaluate the rms speed. (7)

(ii) Determine average kinetic energy of a gas at a temperature  $27^\circ\text{C}$ . (3)

**END**

**Useful equations and constants:**

$$\langle \text{K. E.} \rangle = \frac{1}{2} m v_{\text{rms}}^2 = \frac{1}{2} m \frac{3k_{\text{B}}T}{m} = \frac{3}{2} k_{\text{B}}T$$

$$v_{\text{rms}} = \sqrt{\frac{3PV}{Nm}} = \sqrt{\frac{3Nk_{\text{B}}T}{Nm}} = \sqrt{\frac{3k_{\text{B}}T}{m}}$$

The ideal gas law  $PV = Nk_{\text{B}}T$

Boltzman's constant:  $k_{\text{B}} = 1.38 \times 10^{-23} \text{ JK}^{-1}$ ,

Avogadro's number:  $N_{\text{A}} = 6.022 \times 10^{23} \text{ mol}^{-1}$

Mean free path:  $\lambda = \frac{k_{\text{B}}T}{\sqrt{2}d^2P}$

1 atm =  $1.01 \times 10^5 \text{ Pa}$

Maxwell-Boltzmann Distribution:  $f(V) = 4\pi \left[ \frac{m}{2\pi k_{\text{B}}T} \right]^{\frac{3}{2}} v^2 e^{-mv^2/2k_{\text{B}}T}$
